How the Human Heart Pumps Blood - Interactive Lesson

The Question(TM)

How does the heart keep blood moving through my entire body every second of my life?

Simple Answer(TM)

Your heart is a muscular pump that squeezes about 100,000 times a day to push blood - carrying oxygen and nutrients - to every cell in your body.

QRU Translation(TM)

Think of your heart as a two-story house with four rooms. The top rooms collect blood; the bottom rooms forcefully pump it out. Valves act like one-way doors so blood never flows backward. An electrical spark keeps the rhythm steady.

What's Happening Inside?(TM)

- Blood returning from the body enters the right atrium.
- It drops into the right ventricle, which pumps it to the lungs to pick up oxygen.
- Oxygen-rich blood returns to the left atrium.
- The powerful left ventricle pushes it out to the whole body.

QRU Memory Sentence(TM)

My heart is a lifelong pump - I protect it with movement, rest, and good fuel.

Quick Action Steps(TM)

- Take a 10-minute brisk walk and notice your heart rate rise and recover.
- Check your resting pulse for 15 seconds, then multiply by 4.
