The Question(TM)

How does my body keep blood sugar steady after I eat?

Before you answer, predict: After a carbohydrate-containing meal, does blood sugar usually go up, down, or stay exactly the same first?

<details

<summaryCheck your prediction</summary

It usually goes up first as glucose enters the bloodstream. Then your body releases insulin to help bring blood sugar back toward a healthy range.

</details

Simple Answer(TM)

After you eat, carbohydrates are broken down into glucose, a sugar your body can use for energy. When glucose rises in your blood, your pancreas releases insulin.

Insulin acts like a signal that tells many cells - especially muscle and fat cells - to bring glucose inside. It does this partly by helping move glucose transporters, such as GLUT4, to the cell surface. This helps lower the amount of glucose left in the bloodstream.

In short: insulin helps move glucose out of the blood and into cells where it can be used or stored.
