The Question(TM)

How does my body help keep blood sugar in a healthy range after I eat?

Try this first:

After a meal, where do you think most of the sugar from food goes?

- A. It stays in the blood forever
- B. It moves into body cells to be used or stored
- C. It disappears immediately
- D. It turns directly into insulin

Answer: B. Much of the glucose from food moves from the blood into cells, where it can be used for energy or stored for later.

Simple Answer(TM)

After you eat, carbohydrates are broken down into glucose, a type of sugar that enters your bloodstream. When blood glucose rises, your pancreas releases insulin.

Insulin acts like a signal that tells many body cells, especially muscle and fat cells, to take in glucose. This helps move glucose out of the blood and into cells, keeping blood sugar from staying too high.

Important note: Insulin is often compared to a "key," but it does not literally unlock every cell in the same way. Different tissues handle glucose differently. For example, brain cells can take in glucose without insulin in the same way muscle and fat cells often require insulin signals.
