The Question(TM)

How does my body keep blood sugar steady after I eat?

Before you read: Predict what happens first after a carbohydrate-containing meal:

- A) Muscles use glucose immediately with no signal needed
- B) Blood glucose rises, then the pancreas responds
- C) Insulin turns food directly into energy in the stomach

Keep your answer in mind - you'll check it below.

Simple Answer(TM)

After you eat, glucose from food enters your bloodstream. When blood glucose rises, beta cells in your pancreas release insulin.

Insulin acts like a signal that tells many body cells - especially muscle and fat cells - to bring glucose "doors" called glucose transporters to the cell surface. This helps glucose move out of the blood and into cells, where it can be used for energy or stored for later.

Important precision: Not every cell needs insulin to take in glucose. For example, the brain and some other tissues can take up glucose without insulin. Insulin is still one of the body's main tools for lowering blood glucose after meals.
