- QRU Translation(TM) - ? Full Edition
- What's Happening Inside?(TM) - ? Full Edition
- QRU Memory Sentence(TM) - ? Full Edition
- Quick Action Steps(TM) - ? Full Edition

## The Question(TM)

---

How does my body keep blood sugar steady after I eat - and what can go wrong when insulin is low or cells stop responding well?

## Simple Answer(TM)

---

After you eat, carbohydrates are broken down into glucose, a sugar your body uses for energy. As glucose rises in your blood, your pancreas releases insulin.

Insulin helps move glucose out of the bloodstream and into many body tissues - especially muscle and fat cells - and signals the liver to store extra glucose as glycogen for later. This helps bring blood sugar back toward a healthy range.

Quick check:

Which organ releases insulin?

- A) Liver
- B) Pancreas
- C) Stomach

Answer: B) Pancreas. The pancreas senses rising blood glucose and releases insulin.
