Slide 1: Understanding Sleep and Rest

Sleep is not "doing nothing."

It is active recovery for the brain and body.

- Sleep supports thinking, mood, immunity, metabolism, and physical repair
- Rest is valuable, but it is not the same as sleep
- Better sleep habits can support daily functioning and safety

QRU Key Message:

Sleep is biological maintenance. Rest is helpful recovery. Both matter.

Medical Disclaimer:

This presentation is for general education only. It is not medical advice and does not replace diagnosis, treatment, or care from a licensed healthcare professional.

Speaker Notes:

Welcome participants to QRU's presentation on understanding sleep and rest. Many people think sleep is simply a pause in activity, but sleep is an active biological process that supports

the brain, body, emotions, and recovery. Rest also matters, but it does not perform all the same functions as sufficient, high-quality sleep. Today's goal is to help learners understand the difference and apply practical strategies that may support healthier sleep routines. Remind learners that persistent or serious sleep problems should be discussed with a qualified healthcare professional.

Design & Accessibility Guidance:

Use a high-contrast title slide with a calm image of a sleep-friendly environment. Use large readable fonts: 36-44 pt for the title and 24-32 pt for body text. Avoid placing text over busy images. Suggested alt text: "A calm bedroom scene with soft lighting, representing healthy sleep."

Slide 2: Learning Objectives

By the end of this session, learners will be able to:

1. Explain why sleep is biologically important
2. Identify the difference between sleep and rest
3. Describe basic sleep stages in plain language
4. Recognize common signs of insufficient sleep
5. Apply the QRU SLEEP Check to support healthier sleep habits
6. Know when sleep problems may need professional evaluation

Memory Anchor:

Sleep restores. Rest recharges. Both support resilience.

Speaker Notes:

This session is designed for general public education. Learners do not need medical background knowledge. We will use simple language to explain what sleep does, how it differs from rest, what sleep stages are, and how people can notice signs that sleep may be insufficient. We will also introduce the QRU SLEEP Check, a simple memory tool learners can use to reflect on their habits and choose one practical next step.

Design & Accessibility Guidance:

Keep this slide simple with six numbered objectives. Use icons sparingly, such as a brain, moon, clock, alert symbol, checklist, and care symbol. Ensure icons are paired with text and do not rely on color alone to communicate meaning. Suggested alt text: "Six learning objectives displayed with simple sleep, health, and checklist icons."

Slide 3: Sleep Is Active Maintenance

Sleep supports essential body systems:

- Brain function: learning, memory processing, and attention
- Mood regulation: emotional balance and stress response
- Immune function: normal immune system activity
- Heart and metabolic health: blood pressure, blood sugar, and appetite regulation
- Physical recovery: tissue repair, growth processes, and energy restoration

Plain-Language Explanation:

Sleep is like overnight maintenance for the body.

QRU Key Message:

A good sleep routine cannot solve every health problem, but insufficient sleep can make daily functioning harder.

Speaker Notes:

A helpful way to understand sleep is to think of it as maintenance time. During sleep, the body supports many important functions, including thinking, learning, immune regulation, heart health, metabolism, and physical recovery. Sleep is not wasted time. It is recovery work happening behind the scenes. While one night of poor sleep may happen to anyone, ongoing insufficient or poor-quality sleep can affect health, safety, and quality of life. Avoid promising that sleep habits alone will cure health conditions. Instead, emphasize that healthy sleep is one important part of overall wellbeing.

Design & Accessibility Guidance:

Use a simple "maintenance dashboard" visual with icons for brain, mood, immune system, heart, metabolism, and energy. Avoid crowded diagrams. Use consistent QRU colors and high contrast. Suggested alt text: "A dashboard-style graphic showing sleep supporting the brain, mood, immune system, heart, metabolism, and energy."
