Simple Answer(TM)

Your brain is your body's living control center.

It helps you:

- See, hear, smell, taste, and feel
- Move your body on purpose
- Keep many body functions running automatically
- Pay attention
- Remember and learn
- Solve problems
- Feel emotions
- Imagine possibilities
- Make decisions
- Practice skills and improve over time

Your brain is part of a larger system called the nervous system, which includes the brain, spinal cord, and nerves throughout the body.

A computer can be a useful comparison because computers receive information, process it, and produce results. But your brain is not literally a computer. It is a living organ made of cells. It changes with experience, responds to your body, and is affected by sleep, stress, food, movement, relationships, emotions, and practice.

In one sentence: your brain helps turn body signals, memories, emotions, and thoughts into your experience of being alive.

Tiny wonder: right now, without you having to command it, your brain is helping you breathe, balance your body, notice words, connect meanings, and decide what to pay attention to next.
