How deep breathing lowers stress - Video Script

Video Script

Production notes: Use a calm, steady pace with short pauses. Include captions for all narration. Keep on-screen text brief, high-contrast, and large enough for mobile viewing. Use gentle visuals, no flashing effects, and soft background music or natural sound at low volume. When showing a shift from "alarm" to "recovery," do not rely on color alone; also use labels, icons, motion, and/or shape changes.

| Time | Visual / Direction | Narration / Audio | On-screen Text |

|---|---|---|---|

| 0:00-0:06 | Close-up of a person sitting quietly. Shoulders slightly tense. Slow camera movement. | Stress is not just in your mind. It also shows up in your body. | Stress affects the body |

| 0:06-0:16 | Simple animation: "alarm mode" icon appears. Heartbeat line speeds up. Muscles gently highlighted. | When you feel stressed, your nervous system can shift into fight-or-flight mode. Your heart may beat faster, your muscles may tighten, and your body prepares to react. | Fight-or-flight = alarm mode |

| 0:16-0:26 | Animation of lungs expanding and softening. A hand moves from chest to belly. | Deep breathing helps because breathing is one of the few body functions that happens automatically - but can also be gently guided. | Breathing can be gently guided |

| 0:26-0:42 | Simple body diagram: breath moving low into the rib and belly area; a calm signal traveling upward. | When you slow your breath and let it move comfortably lower in the body, the diaphragm - the main breathing muscle under your lungs - can work more fully. This can send calming signals through body-brain pathways connected to the vagus nerve. | Diaphragm = main breathing muscle |

| 0:42-0:58 | Animation shifts from "alarm" to "recovery" using color, labels, and icons: alarm bell lowers, recovery icon appears, movement slows. | Think of the vagus nerve like a communication line between your body and brain. These signals can support the parasympathetic nervous system - your body's rest-and-recovery system. | Vagus nerve = body-brain line
Rest-and-recovery system |

| 0:58-1:08 | Person's shoulders soften. Breathing slows. Heartbeat animation steadies. | In simple terms: slow, comfortable breathing can help your body move out of high-alert mode and toward a steadier state. | Slow breath sends a calmer signal |

| 1:08-1:22 | Clean animated icons: alarm dial lowering, heart rhythm becoming steadier and more flexible, stress meter easing down. Keep text minimal. | Research connects slow, diaphragmatic breathing with reduced sympathetic arousal - less fight-or-flight activation -

improved heart-rate variability, and lower perceived stress or anxiety. | Less alarm activation
Lower perceived stress |

| 1:22-1:30 | Transition to guided practice. Person sits upright but relaxed. | Let's try a simple version together. Breathe slowly and comfortably - not as deeply as possible. If you feel dizzy, panicky, short of breath, or uncomfortable, stop and return to normal breathing. | Breathe slowly and comfortably |

| 1:30-1:38 | Person places one hand on chest and one hand on belly. | Place one hand on your chest and one hand on your belly. Let your shoulders soften. | One hand on chest
One hand on belly |

| 1:38-1:48 | Gentle breathing timer appears. Belly hand moves slightly as the person inhales. | Inhale through your nose, if that feels comfortable, for about four seconds. Let the lower ribs and belly expand gently. | Inhale gently
1? 2? 3? 4 |

| 1:48-1:58 | Timer shifts to exhale. Person exhales slowly; shoulders remain relaxed. | Now exhale slowly for about six seconds, through your nose or mouth. Let your body soften as the air leaves. | Exhale slowly
1? 2? 3? 4? 5? 6 |

| 1:58-2:08 | Repeat the same inhale-exhale animation once more. Keep pacing unhurried. | One more time: inhale gently. Pause if you need to. Then exhale slowly and comfortably. | Repeat once
Slow and easy |

| 2:08-2:18 | Person sits quietly. Heartbeat line appears steady. Alarm icon is replaced by recovery icon. | Even one or two slower breaths can be a useful reset. With practice, this can become a simple way to support your body during everyday stress. | A simple stress reset |

| 2:18-2:28 | Calm closing shot. Person looks relaxed, with neutral posture. | Deep breathing is a support tool, not a substitute for medical or mental health care. If stress, panic, or breathing difficulties feel severe, frequent, or unsafe, reach out to a qualified professional or emergency support. | Support tool - not a substitute for care |

| 2:28-2:34 | Fade out with simple summary icons: breath, body, brain, recovery. | Slow, comfortable breathing gives your body a calmer signal - and helps you return, one breath at a time. | One breath at a time |
